

Page-break control

Every release note below is short, but each one is pinned to its own page on purpose. jasy paginates automatically - here we override it, the way you would in a real report.

1. Overview

This first note stays on page one. It is deliberately short - there is plenty of room left below it, which is exactly what makes the next break visible.

2. Forced onto a fresh page

This note carries breakBefore, so it starts on page two even though note one left most of page one empty. Page one ends early - that gap is the point.

3. Kept together

PageBreak() and the breakBefore / breakAfter props force a break; keepTogether does the opposite - it refuses to let a block be split across a page boundary, so the sign-off box on page two is never cut in half, wherever it lands.
